News summary:

Nanyang Technological University (NTU) is partnering Hebrew University of Jerusalem (HUJI), the University of New South Wales (UNSW) and the Graduate University of Chinese Academy of Sciences (GUCAS) to study the mechanisms of cell-to-cell communication in bacteria. A greater understanding of the microbes will enable us to come up with better solutions for water and wastewater treatment and industrial processes.

The collaboration, which is an expansion of NTU's global network in environmental sciences research and development, will also help to propel Singapore's efforts to become a global hub for environment and water for business, investment, research and technology.
