

Virtual dissection table for medicine school

THE Lee Kong Chian School of Medicine will be the first in South-east Asia and one of the few medical schools in the world to use a high-technology tool to study anatomy.

The Anatomage Table – a virtual dissection table – offers a realistic and interactive visualisation of full-body, life-size anatomy in 3D.

Students will be able to use a virtual knife to remove layers of tissue and view the body's internal structures. The table will be used primarily to teach anatomy in a student's first two years. The school is Nanyang Technological University's joint medical school with Imperial College London.
