Changing password on android

Email

To change the stored password in an android device,

Select “settings”, then “Accounts & sync”

Select “Exchange ActiveSync”
Select “**General settings**”

Select” **Configure server** “
Change the password.
NTUSECURE

NTUSECURE is setup in such a way (using WPA2 enterprise) that you will need to store your account password in the iphone. Although the iOS will ask you to enter a new password should the stored password is wrong, should it not work for whatever reasons, it will cause the account to lockout.

To prevent this, there is a need to “forget this connection” on the android

Select “Wireless & networks”
Select “NTUSECURE”

Note that NTUSECURE will need to be reconfigured to be able to access it. It can be done here.
