

## **New device greatly helps stroke patients' recovery**

NANYANG Technological University scientists have developed a new device which greatly accelerates recovery in stroke patients.

Thanks to the Synergistic Physio-Neuro Platform, stroke patients who had gone through conventional rehabilitation for a year or more – and had hit a plateau in their recovery – managed to make significant progress in their ability to carry out everyday tasks.

Some of the patients have recovered up to 70 per cent of motor function clinical scores in just a month during the trial of the device.
