President's Science Award

Scientist who traced Sars virus to bats gets top accolade

Shahana Begum

A "battlement" who helped to trace the severe acute respiratory syndrome (Sars) virus to bats and in so solving the mystery of the Covid-19 pandemic, has been awarded the President's Science Award.

Professor Wang Leifeng, a top virologist and expert on bat coronaviruses, was presented the award at the ceremony at the Istana yesterday.

The award is part of this year's President's Science and Technology Awards (PSA) ceremony, which was held yesterday.

Professor Wang, who is a professor of virology at the National University of Singapore (NUS), received the award for his contributions to the understanding of the Sars-CoV-2 virus and its transmission to humans.

"I am extremely honored to receive this prestigious award," said Professor Wang, who is also the director of the Institute of Virology at NUS.

"It is a great honor to be recognized for my work in understanding the origin of the Sars-CoV-2 virus and its transmission to humans.

"I am particularly grateful to the President of the Republic of Singapore, who has always been a great supporter of research and innovation.

"This award is a testament to the importance of research and innovation in our society, and I hope that it will inspire others to pursue careers in these fields.

"I would like to thank my colleagues and my family for their support and encouragement.

"I am also grateful to the National University of Singapore, which has always been a supportive and collaborative environment for research.

"I would like to thank the President of the Republic of Singapore, who has always been a great supporter of research and innovation.

"I would like to thank my colleagues and my family for their support and encouragement.

"I am also grateful to the National University of Singapore, which has always been a supportive and collaborative environment for research.

Professor Wang received the award for his work on the origin of the Sars-CoV-2 virus, which is believed to have originated in bats.

"My research has helped to confirm that bats are the natural reservoir of the Sars-CoV-2 virus, and that it is likely that the virus was transmitted to humans through intermediate hosts.

"This work has helped to improve our understanding of the transmission of the virus, and has contributed to the development of new strategies for controlling the spread of the virus.

"I am also grateful to the National University of Singapore, which has always been a supportive and collaborative environment for research.

"I would like to thank my colleagues and my family for their support and encouragement.

"I am also grateful to the National University of Singapore, which has always been a supportive and collaborative environment for research.

Professor Wang's research has been instrumental in helping to control the spread of the virus, and has contributed to the development of new strategies for controlling the spread of the virus.
