According to a recent study by Singapore's Nanyang Technological University (NTU), Jakarta (pic) and Yangon are sinking more than 20mm in peak years. Photo: AFP

Sprawling coastal cities in South and South-East Asia are sinking faster than elsewhere in the world, leaving tens of millions of people more vulnerable to rising sea levels, a new study says.

Vietnam's most populous urban centre and main business hub, Ho Chi Minh City, was sinking an average of 16.2mm (0.6 inches) annually, topping the study's survey of satellite data from 48 large coastal cities around the world.

The southern Bangladeshi port of Chittagong was second on the list, with the western Indian city Ahmedabad, Indonesian capital Jakarta and Myanmar's commercial hub Yangon also sinking more than 20mm in peak years.

"Many of these fast-subsiding coastal cities are rapidly expanding megacities, where... high demands for groundwater extraction and loading from densely constructed building structures, contribute to local land subsidence," the study says.

Sinking cities are not of themselves a result of climate change, but researchers said their work would give a better insight into how the phenomenon would "compound the effects of climate-driven mean sea-level rise".

More than one billion people will live in coastal cities at risk of rising sea levels by 2050, according to UN Intergovernmental Panel on Climate Change.

The IPCC says that global sea levels could rise by up to 60cm (24 inches) by the end of the century even if greenhouse gas emissions are sharply reduced. – AFP Relaxnews
