Are we equipped to confront AI-generated deepfakes?

The case of creating online harms using generative AI and the impact on victims need to be tackled urgently.

Hannah Yee-Fen Lim

A deepfake is a computer-generated image of a person that can be used to generate fake video, audio, images and videos that are indistinguishable from the original. The technology can be used to create, access and used data and images that are falsely represented as real. The technology can also be used to create, access and used data and images that are falsely represented as real.

The USE OF GENERATIVE AI

A deepfake is a computer-generated image of a person that can be used to generate fake video, audio, images and videos that are indistinguishable from the original. The technology can be used to create, access and used data and images that are falsely represented as real. The technology can also be used to create, access and used data and images that are falsely represented as real.

The EFFECTS OF DEEPFAKES

Deepfakes can be used to manipulate public opinion, to disseminate misinformation, and to harm individuals. They can be used to create, access and used data and images that are falsely represented as real. They can also be used to create, access and used data and images that are falsely represented as real.

THE NEED FOR SOLUTIONS

There are existing laws in many countries that have provisions to deal with deepfakes. However, the effectiveness of these laws is limited by the technical capabilities of the technology. The USE OF GENERATIVE AI
