AEGIS A Fast Authenticated Encryption Algorithm

Hongjun Wu Bart Preneel

Nanyang Technological University KU Leuven and iMinds

AEGIS: A shield carried by Athena and Zeus

Different Design Approaches:

No tweak for the second round

AEGIS: Main features

- Fast
 - AEGIS-128L is 0.30 clock cycles/byte on Haswell (16KB messages)
 - Fully use the pipeline of AES-NI
- Nonce be used only once

AEGIS

- AEGIS-128L
 - 128-bit key, 1024-bit state
- AEGIS-128
 - 128-bit key, 640-bit state
- AEGIS-256
 - 256-bit key, 756-bit state
- Tag: 128-bit

AEGIS: Properties

- Properties
 - Parallelizable: locally
 - No security reduction but easy to analyze
 - Not resistant to nonce reuse
 - Performance: size/speed tradeoff

AEGIS

- Design Rationale
 - Inspiration Pelican MAC
 - [Daemen-Rijmen'05]
 - 128-bit secret state
 - easy to analyze
 - secure up to birthday bound
 - 2.5 times faster than AES
 - Our design: Save the state after each AES round, then construct stream cipher from MAC

AEGIS

- Design Rationale (2)
 - Parallel AES round functions in each step so as to fill the AES instruction pipeline
 - AEGIS-128L can make full use of the 8-stage AES instruction pipeline of Haswell processor

AEGIS-128

AEGIS: Security Claims

- Requirements for secure implementation
 - each key and nonce pair can be used only once
 - if verification fails, the decrypted message and wrong message authentication tag should not be given as output
- Forgery attack: success prob. 2^{-t} with t the tag size
- Key and state cannot be recovered faster than brute force if forgery attack is not successful
 - 128-bit tags strongly recommended

AEGIS: Security

- Authentication
 - a difference in ciphertext passes through at least 4
 AES rounds
 - stronger than Pelican MAC (4 AES rounds) since difference being distributed to at least 4 words
- Encryption
 - AEGIS encryption is a stream cipher with nonlinear state update function
 - differential and linear analysis is precluded

AEGIS: Security

Does authentication affect encryption?

- AEGIS without MAC is vulnerable to a chosen ciphertext attack
- To preclude chosen ciphertext attack
 - 1) if tag verification fails, the decrypted plaintext should not be given as output
 - 2) the tag size should be sufficiently large to resist a chosen-ciphertext attack

(128-bit tag recommended)

AEGIS: Security

Encryption does not weaken authentication

- At each step, AEGIS leaks 128-bit keystream, i.e., 128bit state information
- The overall differential probability of the forgery attack against AEGIS increases
- But the differential probability that a difference propagates through 5 AES rounds is not affected
 - reason: at each step, the information leaked on $S_{i,j}$ is of the form:

$$S_{i,1} \oplus (S_{i,2} \& S_{i,3}) \oplus S_{i,4}$$

AEGIS: Security Randomness of keystream

- Recent results (Minaud, SAC 2014)
 - AEGIS-128
 - 2¹³⁰⁺ keystream bits for distinguishing
 - AEGIS-256
 - 2¹⁸⁰⁺ keystream bits for distinguishing
 - AEGIS-128L
 - So far, no results (expected to be strong)

Performance

- Speed on Haswell processor (AEGIS-128L)
 - 0.30 cycles/byte (16KB messages)
 - 0.37 cycles/byte (4KB messages)
 - 0.51 cycles/byte (1KB messages)
 - 1.11 cycles/byte (256B messages)
 - 3.44 cycles/byte (64B messages)

Performance

• Hardware

- Area/Throughput tradeoff
- FPGA implementation of AEGIS-128
 - Debjyoti Bhattacharjee, Anupam Chattopadhyay at DIAC 2015
 - For throughput optimized: 121Gbps, 173 KGE
- AEGIS-128L can be about twice as fast as AEGIS-128, with larger area (60% more).

Discussions

- We restrict the disclosure of plaintext when authentication failed
 - What would happen if the attacker knows the decrypted plaintext when authentication failed?
 - For AGEIS, the state may be recovered, but not the secret key: so there is little compromise of encryption security (since the attacker can access to the decrypted plaintext, the encryption security is not a concern here)
 - If the communication protocol terminates/restarts when authentication fails, then there is no compromise of authentication security

Conclusions

- Simple design
- Fast
 - Software: targeting platforms with AES-NI
 - Also fast in hardware
- Strong in security
